MicroWorld Launches MailScan 6.1

By Enterpriser Staff | Apr 21, 2009 1535 hrs IST

MicroWorld, the developer of information security solutions, has announced the release of a new version of its MailScan range of AntiVirus, AntiSpam and Content Security solution for Mail Servers. MailScan 6.1 precedes its earlier versions with a collection of new and advanced features, offering enhanced protection against infections caused by virus, spam and phishing e-mails.

MailScan 6.1 is equipped with 'intelligent' filters and non-intrusive learning pattern (NILP) technology, along with comprehensive content security. The NILP technology analyzes e-mails based on the behavioral pattern of the user to prevent spam. The new MailScan 6.1 also has an upgraded anti-virus scan engine that is equipped with an advanced heuristic scanner that scans incoming and outgoing e-mails. This helps in blocking malware at the mail server at the outset before reaching a receipient's inbox. MailScan 6.1 also provides real-time information to the system administrators about virus outbreak alerts and spam alerts.

The Scanner Administrator of MailScan 6.1 allows network professionals to perform crucial tasks like adding local primary domain, configure settings for auto-download of updates and patch Internet Explorer vulnerabilities. Scanner Administrator also has options to block or allow certain types e-mail attachments from entering and leaving your mailing system -- reducing the probability of getting infected by a particular kind of attachment. MicroWorld feels its two-way scanning function of this latest version provides the system with real-time protection with its advanced heuristic scanner, will prove to be useful to its novice as well as network professionals.
