MicroWorld Releases MailScan 6.1

Techtree News Staff, Apr 21, 2009 1824 hrs IST
With advanced heuristic scanner

MicroWorld has released a new version of MailScan range of AntiVirus, AntiSpam and Content Security solution for Mail Servers - MailScan 6.1.

MailScan 6.1 is equipped with the NILP technology based on Artificial Intelligence (AI) which analyzes emails based on the behavioral pattern of the user to prevent spam. The new MailScan 6.1 also has an upgraded AntiVirus scan engine that is equipped with advanced heuristic scanner that scans both incoming and outgoing emails, effectively blocking Malware at the MailServer before they reach the inbox of the recipients, the company said. MailScan 6.1 also provides real time information to the system administrators about Virus Outbreak Alerts and spam alerts.

The Scanner Administrator of MailScan 6.1 allows you to perform crucial tasks like adding local primary domain, configure settings for auto-download of updates and plug Internet Explorer vulnerabilities that allow Virus to enter your system. Scanner Administrator also gives you options to block or allow such e-mail attachments from entering and leaving your mailing system.
