About eScan Internet Security Suite

MicroWorld eScan Internet Security Suite is a comprehensive antivirus and content security solution for Microsoft Windows operating systems. The V10 release continues to deliver excellent protection against malware, spam, keyloggers, phishing attempts and other similar threats for your computer.

All-round Protection

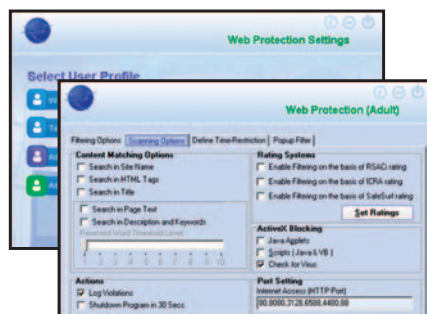

Whether you're a beginner or an expert user, eScan Internet Security Suite is designed with a friendly single-screen GUI for quicker access to both the virus monitor and on-demand

scanner screen. The included Firewall Protection enables easy configuration to define trusted MAC addresses, application rules, while expert users will appreciate the advanced firewall rule options available to better protect the system from network-based attacks. As the virus definition database is kept up-to-date at regular intervals, your system will be protected against any new threats.

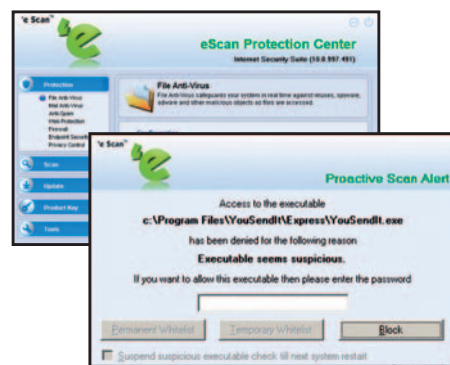

Keeps a Close Watch

In addition to performing real-time virus scans, eScan Internet Security Suite features Proactive Protection that constantly monitors your system for any unexpected changes in the Windows registry. Applications that are deemed suspicious will be prohibited from running unless the eScan administrator password is correctly entered in the popup window.

Making the Web Safe For Kids

Leaving your Internet browser open in the vicinity of younger children is bound to

expose them to adult subject matter. The Web Protection feature in eScan Internet Security Suite offers four unique user profiles that tailor the web access experience to suit the younger audience. It also includes a high level of customizability, from content blocking to rating-based filtering to make the Internet a safer place for everyone in the family.

Early Prevention

With effective endpoint security controls for applications and USB devices, eScan Internet Security Suite allows you to prevent certain applications from running, as well as to disable and limit the access to USB storage devices. To reduce the likelihood of data theft and virus infections, the inserted USB device can be restricted to read-only access, while a virus scan can be scheduled to start upon USB device insertion.

Take It For A Spin
